OPERATIONAL DELIVERY STANDARD

White-Label Agency Delivery Standard Operating Procedure (SOP)

This document outlines TeamOnTime OS standard operating procedure for invisible engineering pod delivery. It defines sprint workflows, staging container isolation, git branching standards, and bilateral NDA compliance for partner digital agencies.

Phase	Standard Operating Requirement	Governance
1. Technical Intake	Complete technical spec review; map developer hours (160h/mo per pod); execute bilateral non-solicitation NDA.	Legal / Pod Lead
2. Staging Isolation	Spin up password-protected staging container; inject HTTP noindex headers; configure isolated database.	DevOps Engineer
3. Git Branching	Enforce Git-Flow architecture; maintain production/main branch protection; require senior pull-request approval.	Senior Architect
4. Sprint Execution	Run bi-weekly sprint cycles; manage tasks transparently in agency PM software (Jira/Asana) under agency brand.	Pod Sprint Master
5. Pre-Flight QA	Execute 42-point technical QA checklist; audit sub-50ms TTFB and Core Web Vitals prior to client demo.	QA Engineer
6. DNS Cutover	Execute zero-downtime DNS deployment; remove staging access; transfer repository IP to agency partner.	Engineering Lead
